

## Davits

Davits are beneficial when the parapet or guardrail is non-structural or use of a powered platform is necessary. However, serious damage and injury may result in the improper installation of a davit system. Therefore, it is essential that each installation is performed, tested, and certified under the supervision of a professional engineer. Installation of a davit system generally includes wrapping an I-beam, weldment, cast-in-place or bolting through a concrete slab. In either retrofit application or a new construction project, the project engineer is responsible for the design of the structure and welding details to support these large loads.
